The Future of CD Spectroscopy – The Power of Quantitative Circular Dichroism

Dr. Anna Łęczkowska

The huge increase in the use of biotherapeutics in recent years has led to the search for rapid and accurate methods for evaluating the similarity of batches of the originator product, or of the originator and generic products. In this presentation, we will demonstrate how qCD can be used to give a precise, quantitative measure of protein similarity, and will use case studies to show how the comparisons are made.
